Device-independent reproduction of colour is the qualities of image reproduction achieved through the use of different input and output devices, for instance colour monitors and graphic user interfaces. Edited by highly regarded authors and leaders in the field, this authoritative text on colour management systems provides leading edge coverage of this key aspect of design and presentation. It is a valuable resource for colour engineers, colour scientists, imaging professionals and students in engineering colour systems, as well as hardware (computer displays) designers and production engineers of digital imaging equipment.
