"The Scientific Worldview" presents a balanced theoretical perspective that has profound implications for the social and physical sciences. Author Glenn Borchardt outlines the philosophical alternatives and those necessary for consistent scientific thinking. The balanced outlook requires beginning assumptions alien to classical mechanism and modern systems philosophy. The central concept of the resulting philosophical system is univironmental determinism-a new universal mechanism of evolution founded on the simple proposition that whatever happens to a thing is a result of the infinite variety of matter in motion within and without. Borchardt argues that the biased outlook of the twentieth century "scientific worldview," systems philosophy, which overemphasizes systems and neglects environments, taints our most fundamental theories about the universe. But with the philosophy of univironmental determinism, we can gain the feeling of control in our lives and achieve a newfound level of consciousness through which we "will" change the world for the betterment of all.
