More than 30,000 cases of MCUOs are identified in the United States each year, and since treatment plans for tumors are predicated largely on their primary sites, the treatment of these tumors is especially difficult. This unique text provides a framework for approaching these complex issues, with contributions from international experts in the field of MCUOs. The book is divided into five topic areas, covering clinical

presentations, methods of pathologic evaluation, techniques for topographic localization, and treatment and prognosis of carcinomas of unknown anatomic source, as well as postmortem validation studies pertaining to those subjects.
