Spider monkeys are one of the most widespread New World primate genera, ranging from southern Mexico to Bolivia. Although they are common in zoos, spider monkeys are traditionally very difficult to study in the wild, because they are fast moving, live high in the canopy and are almost always found in small subgroups that vary in size and composition throughout the day. This book, compiled in 2008, is an assimilation of both published and previously unpublished research. It is a comprehensive source of information for academic researchers and graduate students interested in primatology, evolutionary anthropology and behavioral ecology and covers topics such as taxonomy, diet, sexuality and reproduction, and conservation.

作者介绍:

Christina J. Campbell is a research associate of the Cotsen Institute of Archaeology at the University of California, Los Angeles. She teaches courses in Biological Anthropology at The California Institute of Technology and Santa Monica College. Her research interests include behavioral ecology and reproductive endocrinology and physiology.
