Hawai'i's Mauna Loa Observatory (MLO) is one of the world's leading scientific stations for monitoring the atmosphere. For more than fifty years, beginning with atmospheric chemist Charles Keeling's readings of carbon dioxide levels in the atmosphere, MLO has provided climate scientists with a continuous record of the atmosphere's increasing concentration of carbon dioxide--and sparked the international debate over global warming. Fifty Years of Monitoring a Changing Atmosphere tells the story of the

men and women who were responsible for these and many other measurements near the summit of the world's largest mountain.
