著者:Richard B. Goldschmidt

出版者:Yale University Press

出版时间:1982-09-10

装帧:Paperback

isbn:9780300028232

In this book, Goldschmidt inquires into the types of hereditary differences that produce new species. Goldschmidt used a wide range of research to formulate his own picture of evolution. Contrary to near-unanimity among scientists, he insisted that the neo-Darwinian theory of micromutations applied only within species and was no longer tenable as a general theory of evolution. Instead, Goldschmidt claimed, macroevolution resulted from larger jumps in genotype - across "bridgeless gaps" - related either to systemic mutations or to mutations affecting early development.

在“基因化身肉体”（the genes become flesh）的胚胎早期阶段，胚胎就是一个放大器，微小的改变会在发育过程中被放大。这是伯克利的遗传学家理查德·高兹施密特（Richard Goldschmidt）在他的主要著作《进化的物质基础》中提出的。
